SUMMARY

Software engineer, 10 years shipping production applications in React, React Native and Node.js, with Python back ends more recently, now building AI-native systems end to end. I design agent architectures where the hard parts aren't the prompts: bounded tool-calling loops, multi-agent orchestration with durable execution, model routing that trades cost against capability, and guardrails that survive adversarial input — injection screening, abuse cooldowns, and tenant isolation enforced structurally rather than by instruction. Built as a founder, so I've owned the whole surface: architecture, security, cost, observability and the product decisions behind them.

EXPERIENCE

Istibqa Ltd — Co-founder & Chief Technology Officer

2026 – Present · Blackpool, UK · Built and pre-launch; not raising

Technical co-founder of **Tadhkir** (tadchkirapp.com) — a WhatsApp retention platform for recurring-visit service businesses across the UK, Gulf, US and Africa.

- **Built a data-aware, tool-calling copilot** on the Anthropic SDK: a bounded agent loop capped at 6 rounds, driving a customer-facing and an internal surface from one shared engine so guardrails can't drift between them.
- **Made tenant isolation structural, not prompted.** Tool handlers take server-resolved context and never accept a tenant selector from the model — cross-tenant reads are impossible by construction, not by asking the model nicely.
- **Layered the guardrails:** input caps, per-user and global rate limits, injection and system-prompt-exfiltration screening that refuses *without* calling the model, a strike-based abuse cooldown, and output scrubbing of credential-shaped strings.
- **Cut inference cost and handled failure:** a cheap Haiku classifier gates the expensive Sonnet loop and fails open, so an outage degrades to "more expensive" rather than "copilot down".
- **Engineered to the published DPA** — copilot tools return aggregates only, never individual records, so no customer PII reaches the model provider.
- Shipped multi-market billing (Stripe + Paystack, six currencies), WhatsApp Cloud API messaging in 10 languages, and CSV/document ingestion. 12 ADRs; engine unit-tested against a mocked SDK plus Playwright suites.

Next.js 16, React 19, TypeScript, Supabase/PostgreSQL, Anthropic SDK, Stripe, Paystack, Vitest, Playwright.

Minigigs Ltd — Founder & Principal Engineer

2024 – Present · Blackpool, UK · R&D vehicle; not raising

Building **Eugenius AI**, an agentic platform generating production-grade web applications from conversation, natively in the user's own language. ~67K LOC, working beta.

- **Multi-agent orchestration with durable execution.** A 7-agent pipeline (architect, generator, reviewer, test, deploy) with parallel and sequential stages, running as checkpointed Inngest jobs — a multi-minute build resumes from the last completed stage instead of losing state.
- **Multi-model routing** across Anthropic and OpenAI, selecting per task by capability, latency and cost rather than paying frontier prices for every step.
- **Retrieval plus a correction-learning loop.** A Pinecone-backed store over generated projects; the system extracts patterns from the edits users make to its output and feeds them into later generations, without manual labelling. Runtime errors from deployed apps route back into the loop to diagnose and patch them.
- **Held to production standards under my own name:** strict TypeScript, CI gates on lint/typecheck/coverage, conventional commits, ADRs, build-time i18n across six locales. Ran a full pre-launch self-audit, documented the security gaps honestly and drove the remediation rather than shipping on a claim.

Next.js 16, React 19, TypeScript, Prisma 7, PostgreSQL, Anthropic + OpenAI SDKs, Pinecone, Inngest.

Luciana's Grill to Zerli — Senior React / React Native Engineer

Dec 2022 – Jun 2024

Built the group's ordering platform from zero; when the venue wound down, re-architected it into **Zerli**, a multi-tenant restaurant-ordering SaaS now preparing for launch.

- Shipped iOS and Android apps (React Native) and the web ordering front end, owning architecture through store release.

- Designed the Node.js/PostgreSQL backend behind menu management, order routing and kitchen operations; **migrated off Firestore to PostgreSQL** with reversible migration scripts.
- Re-architected single-venue into multi-tenant — data isolation, per-venue configuration, onboarding — and integrated Stripe and Pystack end to end, including webhooks, refunds and reconciliation.

VDesign Heritage — Senior Software Engineer

Jan 2021 — Dec 2022 · Remote

- Led delivery of web and mobile products in an Agile team, owning technical direction from scoping to release; ran code review, profiling and production incident response; mentored engineers through pairing.

Earlier — Quintype, InfiniteLoop, Codigoworld, Tornix

Jan 2016 — Dec 2020 · Bangalore, India

- React Native work on a digital-publishing SaaS serving news and media publishers; front-end architecture, reusable component systems and e-commerce integrations across client builds; mentored juniors and ran code review. Earliest work in PHP/MySQL web applications and authentication.

TECHNICAL SKILLS

AI / LLM engineering — Anthropic Claude SDK, OpenAI SDK, tool use / function calling, agent loops, multi-agent orchestration, RAG and vector search (Pinecone), prompt design, model routing and cost optimisation, LLM guardrails (injection screening, rate limiting, output scrubbing), failure-mode handling, evals

Languages — TypeScript, JavaScript, Python, SQL

Python — FastAPI, SQLAlchemy 2.0 + Alembic, Pydantic v2, Celery / Redis, pytest, OpenAI SDK

Frontend — React 19, Next.js 16, React Native, Expo, Redux, Tailwind

Backend — Node.js, Express, Nest.js, Prisma, PostgreSQL, Supabase, MongoDB, GraphQL, Inngest, WebSockets, REST API design

Practice — AI-assisted development (Claude Code, daily), CI/CD, Vitest / Jest / Playwright, observability (Sentry, OpenTelemetry), build-time i18n, security (multi-tenant isolation, CSP, RLS, secrets management), ADRs, conventional commits

SELECTED PROJECTS

Python work — A FastAPI back end layered into `api/core/models/services/tasks`: SQLAlchemy 2.0 with Alembic migrations on PostgreSQL, Celery and Redis workers, JWT auth, and a twelve-file pytest suite over auth, billing and security. Separately, multi-agent orchestration in Python with encryption, compliance and payment layers.

Also built — Eight further applications in the last two years, all AI-native: a payments platform on Prisma/PostgreSQL with Sentry and tests, a Supabase marketplace, a Stripe ordering flow, a healthcare talent marketplace, a multi-provider Anthropic + OpenAI generator with i18n, and an offline-capable React Native tracker. Indexed at ambasseugene.github.io.

EDUCATION

Bachelor of Computer Applications (BCA) — Bangalore University, 2012–2015

WRITING

Web Scraping with Node.js and *URL Shortener Service for Beginners* — further writing at dev.to/ambasseugene and medium.com/@eugene.ambass
