SUMMARY

Software engineer with 10 years shipping production applications in React, React Native and Node.js — and more recently Python back ends alongside them — now building AI-native systems end to end. I've designed and shipped agent architectures where the hard parts aren't the prompts: bounded tool-calling loops, multi-agent orchestration with durable execution, model routing that trades cost against capability, and LLM guardrails that hold up under adversarial input — prompt-injection screening, abuse cooldowns, and tenant isolation enforced structurally rather than by instruction.

I've built these as a founder, which means I've owned the whole surface: architecture, security, cost, observability, i18n and the product decisions behind them. Looking to bring that depth to a team building AI products at scale.

EXPERIENCE

Istibqa Ltd — Co-founder & Chief Technology Officer

2026 – Present · Blackpool, UK

Technical co-founder of **Tadhkir** (tadchkirapp.com) — a WhatsApp retention platform for recurring-visit service businesses (dental, optical, physio, salons) across the UK, Gulf, US and Africa. Own architecture, engineering and delivery.

- **Built a data-aware, tool-calling copilot** on the Anthropic SDK: a bounded agent loop (model → `tool_use` → `tool_result`, capped at 6 rounds) powering two surfaces — a customer-facing Revenue Copilot and an internal Admin Copilot — from one shared engine, so guardrails can't drift between them.
- **Made multi-tenant isolation structural, not prompted.** Tool handlers receive server-resolved context and never accept a tenant selector from the model, so cross-tenant reads are impossible by construction rather than by asking the model nicely.
- **Designed a layered LLM guardrail pipeline:** input caps, per-user and global rate limits, prompt-injection and system-prompt-exfiltration screening that refuses *without* calling the model, a strike-based abuse cooldown, and output scrubbing of credential-shaped strings.
- **Cut inference cost** by gating the expensive Sonnet tool loop behind a cheap Haiku classifier that rejects off-scope requests before any billable call — protecting credits against off-label use of the assistant.
- **Engineered to the published DPA:** no customer PII reaches the model provider. Copilot tools return aggregates only — numbers, not people — with individual records handled in the dashboard.
- Shipped multi-market billing (Stripe + Paystack across six currencies), WhatsApp Cloud API messaging in 10 languages, CSV and document ingestion, and a tiered affiliate engine.
- Maintain 12 Architecture Decision Records; copilot engine covered by unit tests against a mocked SDK plus Playwright end-to-end suites.

Stack: Next.js 16, React 19, TypeScript, Supabase/PostgreSQL, Anthropic SDK, Stripe, Paystack, WhatsApp Cloud API, Vitest, Playwright, Netlify.

Minigigs Ltd — Founder & Principal Engineer

2024 – Present · Blackpool, UK

Building **Eugenius AI**, an agentic platform that generates production-grade web applications from conversation — natively in the user's own language. ~67K LOC, working beta.

- **Multi-agent orchestration.** Designed a 7-agent pipeline (architect → generator → reviewer → test → deploy) with parallel and sequential execution, shared context propagation, and durable background workers via Inngest — so a multi-minute build survives restarts and partial failure instead of losing state.
- **Multi-model routing.** Built a router across Anthropic and OpenAI models that selects per task by capability, latency and cost, rather than paying frontier prices for every step.
- **Retrieval and a learning loop.** Pinecone-backed vector store over generated projects and user corrections; the system observes the edits users make to its output, extracts the pattern, and feeds it into later generations without manual labelling.
- **Self-healing after deploy.** Runtime error signals route back into the agent loop to diagnose and patch live applications — closing the gap that code-generation tools leave when they stop at generation.
- **Language-native generation.** Built a build-time i18n compiler (`next-intl`, six locales) and a generation path that writes natively in the target language instead of translating English output.
- **Held the codebase to production standards under my own name:** strict TypeScript, CI gates on lint/typecheck/coverage, conventional commits, ADRs. Ran a full pre-launch self-audit, documented the security gaps it found honestly, and drove the remediation sprint rather than shipping on a claim.

Stack: Next.js 16, React 19, TypeScript, Prisma 7, PostgreSQL, Anthropic + OpenAI SDKs, Pinecone, Inngest, NextAuth, Tailwind, Jest.

Luciana's Grill — Senior React / React Native Engineer

Dec 2022 – Jun 2024

Built the group's ordering platform from zero. When the venue wound down, re-architected the system into **Zerli**, a multi-tenant restaurant-ordering SaaS now preparing for launch and pre-seed raise.

- Shipped customer-facing iOS and Android apps (React Native) and the web ordering front end, owning architecture through App Store and Play Store release.
- Integrated payment gateways end to end — checkout, webhooks, refunds and reconciliation — for live transactions.
- Designed and built the Node.js/PostgreSQL backend behind menu management, order routing and kitchen operations.
- Re-architected a single-venue system into a multi-tenant SaaS: tenant data isolation, per-venue configuration and onboarding.

VDesign Heritage — Senior Software Engineer

Jan 2021 – Dec 2022 · Remote

- Led delivery of web and mobile products in an Agile team, owning technical direction from scoping through release.
- Ran code review, profiling and optimisation across the front-end codebase; owned deployments and production incident response.
- Mentored engineers through pairing and review.

Quintype Technologies — React Native Engineer

Sept 2019 – Dec 2020 · Bangalore, India

- Built React Native mobile experiences on a digital-publishing SaaS platform serving news and media publishers.
- Contributed to review, debugging and performance work across a fast-moving product team.
- Partnered with UI/UX on usability and accessibility standards.

InfiniteLoop Tech — Full-Stack Software Engineer

Mar 2019 – Sept 2019 · Bangalore, India

- Built mobile applications from design through REST API integration, and the reusable component layer shared across client projects.

Codigoworld Tech — Frontend (React / React Native) Engineer

Feb 2018 – Mar 2019 · Bangalore, India

- Owned project planning, scoping and front-end architecture on client builds; built data-driven reusable component systems and integrated e-commerce flows.

- Mentored junior developers and interns; ran code review and task assignment.

Tornix Tech — Junior Developer

Jan 2016 – Jan 2018 · Bangalore, India

- Built web UIs and PHP/MySQL authentication systems; ran SEO optimisation and site audits.

SELECTED PROJECTS

Tadhkir — WhatsApp retention platform with a guardrailed, tool-calling AI copilot. Multi-market, multi-currency, 10 languages. tadhkirapp.com

Eugenius AI — Agentic app builder. 7-agent orchestration, multi-model routing, RAG, self-healing deploys, language-native generation. ~67K LOC.

Zerli — Multi-tenant restaurant-ordering SaaS grown out of a single-venue build. React Native + Node/PostgreSQL.

Python work — A FastAPI back end layered into `api / core / models / services / tasks`: SQLAlchemy 2.0 with Alembic migrations on PostgreSQL, Pydantic v2, Celery and Redis background workers, JWT auth, structured logging, OpenAI SDK, and a twelve-file pytest suite over auth, billing and security. Separately, multi-agent orchestration in Python with encryption, compliance and payment service layers. ~3.7K LOC across the two.

Also built — Eight further applications in the last two years, all AI-native: a payments platform on Prisma/PostgreSQL with Sentry and tests, a Supabase marketplace, a Stripe ordering flow, a healthcare talent marketplace, a multi-provider Anthropic + OpenAI generator with i18n, and an offline-capable React Native tracker. Indexed at ambasseugene.github.io.

TECHNICAL SKILLS

AI / LLM engineering — Anthropic Claude SDK, OpenAI SDK, tool use / function calling, agent loops, multi-agent orchestration, RAG and vector search (Pinecone), prompt design, model routing and cost optimisation, LLM guardrails (injection screening, rate limiting, output scrubbing), evals

Python — FastAPI, SQLAlchemy 2.0 + Alembic, Pydantic v2, Celery / Redis, pytest, OpenAI SDK, structlog

Frontend — React 19, Next.js 16, React Native, Expo, TypeScript, Redux, Tailwind, Framer Motion

Backend — Node.js, Express, Nest.js, Prisma, PostgreSQL, Supabase, MongoDB, GraphQL, Inngest, WebSockets, REST API design

Engineering practice — CI/CD, Vitest / Jest / Playwright, observability (Sentry / GlitchTip, OpenTelemetry), build-time i18n, security (multi-tenant isolation, CSRF, CSP, RLS, secrets management), ADRs, conventional commits

EDUCATION

Bachelor of Computer Applications (BCA) — Bangalore University, 2012–2015
